# INTERNATIONAL UNION FOR THE PROTECTION OF NEW VARIETIES OF PLANTS GENEVA

## TECHNICAL WORKING PARTY FOR FRUIT CROPS

Forty-Second Session Hiroshima, Japan November 14 to 18, 2011

#### CONCEPT OF A DATABASE CONTAINING PEA VARIETY DESCRIPTIONS

Document prepared by experts from France

#### INTRODUCTION

- 1. At its forty-fourth session, held in Veliko Tarnovo, Bulgaria, from July 5 to 9, 2010, the Technical Working Party for Vegetables (TWV) considered a survey presented by Mr. François Boulineau (France) (see documents TWV/44/33 "Review of Grouping Characteristics in the Test Guidelines for Pea" and TWV/44/33 Add.).
- 2. The TWV agreed that it would be useful to seek responses to the questionnaire from a wider number of UPOV members and agreed that the questionnaire should be re-issued to the TWV with copies of documents TWV/44/33 and TWV/44/33 Add. in order to indicate the usefulness of contributing information. It also agreed that it should be clarified in the questionnaire that there would be anonymity for the contributing UPOV members. In addition, the TWV agreed that Mr. Boulineau should make a further study on characteristic 15 "Stem: number of nodes up to and including first fertile node" with particular regard to the calibration of scales between the contributors to the questionnaire.
- 3. In response to the observation of Mr. Boulineau that the results of the questionnaire indicated substantial potential benefits in developing a database containing pea variety descriptions from members of the Union, at least for grouping characteristics as first step, the TWV agreed that Mr. Boulineau should make a presentation on his concept at the forty-fifth session of the TWV. The TWV agreed that Mr. Boulineau should organize an exchange of a common set of variety descriptions for grouping characteristics, and possibly a

# TWF/42/13 page 2

ring test, to examine if grouping characteristics were sufficiently reliable for such an approach. It noted that it would be important to involve the TWA experts in that work.

- 4. The Technical Committee (TC), at its forty-seventh session held in Geneva, from April 4 to 6, 2011, agreed to request the experts from France to present the concept of a database containing pea variety descriptions of members of the Union to the Technical Working Parties at their sessions in 2011 and to the Technical Committee at its forty-eighth session (see document TC/47/26 "Report on the Conclusions", paragraph 34).
- 5. The Annex to this document presents a proposal of a concept of a database containing pea variety descriptions prepared by experts from France.

[Annex follows]

#### TWF/42/13

#### **ANNEX**

#### CONCEPT OF A DATABASE CONTAINING PEA VARIETY DESCRIPTIONS

Question 1: Varieties constituting the reference collection (see Appendix 1):

The number of varieties constituting the reference ranges from 57 to 3,250.

A subsequent study carried out by France shows that the varieties that might be considered for inclusion in a collection would include:

- 1,521 varieties for the Common Catalogue (Vegetables/Agricultural Plants), Organisation for Economic Cooperation and Development (OECD) list and the Community Plant Variety Office (CPVO) database
- + 2,000 entries contained only on the UPOV CD-ROM Plant Variety Database but which certainly do not all correspond to officially recognized varieties.

This number does not take account of the candidate varieties, a number which is difficult to obtain.

## Questions 2 and 3: Nature of groupings used (see Appendix 2):

The vast majority of countries that have responded to the survey use the Test Guidelines grouping characteristics in order to:

exclude varieties from trials (a) or classify the varieties in trials within distinguishing groups (b).

Some countries use more characteristics than those advised by the UPOV Test Guidelines (countries 3, 6 and 8 in particular), but it must be possible to reach agreement on a common list of sufficiently stable characteristics to be included in a centralized database.

### Question 4: Varieties to be compared with candidate varieties (see Appendixes 3 and 4):

Two descriptions were sent to participant countries (one corresponding to a vegetable pea and the other to an agricultural pea). These descriptions included the information contained in the UPOV Technical Questionnaire.

Each country should provide the varieties which it would put in place in the field if it received this type of request and by applying its own set of grouping characteristics.

Only three responses have been able to be used but still the results are interesting:

### Group 1 – Vegetable pea:

Country 3 = 37 varieties to be compared
Country 6 = 48 varieties to be compared
Country 8 = Five varieties to be compared

The total number of varieties cited by at least one country is 66:

# TWF/42/13 Annex, page 2

- → no variety is selected by three countries
- $\rightarrow$  22 varieties are selected by two countries only, i.e. 33 per cent.

In 23 cases (i.e. 33 per cent of cases), the reason for the non-choice of the variety is: variety not present or not described in the database of the country concerned.

The other causes of difference are mainly due to different notes in the databases or to different significance ranges (notes 4 and 6 do not differ from 5 in certain countries, but differ in others).

### Group 2 – Agricultural pea:

Country 3 = 48 varieties to be compared Country 6 = 31 varieties to be compared Country 8 = One variety to be compared

The total number of varieties cited by at least one country is 63:

- → no variety is selected by three countries
- $\rightarrow$  16 varieties are selected by two countries only, i.e. 25 per cent.

The reason for non-choice of varieties has not been supplied by two countries and this aspect cannot therefore be analyzed.

# Conclusion

The grouping characteristics selected by UPOV are in general reliable and robust characteristics (resistant to genotype/environment interaction); they therefore vary only very little between different countries excluding species known to be sensitive to certain climatic elements (onion and photoperiod for example).

In these conditions, it may be envisaged to introduce for certain species, such as pea, a joint database containing all the varieties for consideration as a part of the reference collection. The information relating to the grouping characteristics alone could therefore be brought together by means of this database (while preserving the origin of the description), so that each country may define the varieties for potential inclusion in its trials and thus harmonize and improve the situation observed through question 4.
